

Depth Tracking System

The Polaris depth tracking system is compact, wireless and easily deployed and operated providing weight-on-bit, rate of penetration and depth data to your logging application. The touch-screen formatted user interface is neatly organized into tabbed sections making it easy and intuitive to operate. The highly reliable wireless spread spectrum radios eliminate data transmission loss over long distances. The Polaris depth tracking system works on a wide variety of drilling rigs, from conventional drill rigs to pull down rigs, with a geolograph line or a drum encoder.

Polaris also supplies all encoders, pressure transducers and cables for a complete depth tracking solution.

WITS data transmitted includes:

- Block height
- Bit depth
- Hole depth
- Weight on bit
- Rate of penetration
- Hookload
